Population

The Population Chapter in this year's *State of the City* contains decennial census data. Its primary intent is to present 1990 demographic, social and economic census information, often in comparison to earlier years and other geographic areas. Comparative data from past census have been extracted from previous *State of the City* issues and from various U.S. Census publications.

The 1999 estimates of the total population of the City of Minneapolis, persons per household and household population were provided by the Twin Cities Metropolitan Council. These estimates are based on 1990 census data and are adjusted using data such as construction permits, demolition permits, IRS filings, INS records and Minneapolis Public School student records. The Minneapolis Planning Department believes there are more people per household and a greater population than Metropolitan Council estimates. However, there is no data available to support this belief until the 2000 census data is released on April 1, 2001.

This chapter can also be found on the city's web site at: www.ci.minneapolis.mn.us/planning

Total Population and Household Characteristics

Total Population and Household Characteristics

The most recent estimate of total Minneapolis population is 358,610 for 1999. This reflects a continued decrease from the 1998 estimate of 360,591 and the 1997 estimate of 362,090. The estimated loss in population for the 1990 to 1999 period is 9,773 persons. The 1990 census data reflected a decline in the number of residents living in family households and a larger share of non-family households relative to family households.

In 1990, there were 160,682 households in Minneapolis (159,794 is the 1999 estimate), compared to 161,858 in 1980 (each occupied housing unit has one household in it). A total of 351,705 persons lived in households in 1990 (341,918 is the 1999 estimate), an average of 2.19 persons per household (2.14 persons per household is the 1999 estimate). This 2.19 figure was identical to the 1980 average household size, but slightly smaller than that of 1970. Also in 1990, nearly 52 percent of households identified themselves as non-family (only unrelated individuals or a single individual living in an occupied housing unit). This was the first census in which more non-family than family households were identified in the city.

METROPOLITAN GROWTH, 1900 TO 1990

MINNEAPOLIS POPULATION, 1950-1999

Year	Population	Decade Loss
1950	521,718	38,846
1960	482,872	48,472
1970	434,400	63,449

Total	161,858	100	160,682	100	-1,176	

Community Population and Age Distribution

Although the total Minneapolis population declined by less than one percent between 1980 and 1990, it increased or declined to varying degrees within geographic sub-areas around the city.

During the 1980s the city's adult and preschool populations increased. School age, young adult, middle age and senior populations decreased. When compared to 1970, the city's adult population is the only age category that experienced a net increase in percent share.

The rapid growth in the adult age category appears to be associated with the increase in the number of preschool (under 5) children reported in 1990, as the relatively large adult "baby boom" population continues to move through its child-bearing years. There has been a continual increase in Minneapolis Public School student enrollment at the elementary level since 1983. The following table details the change in population by age category for the 1970 to 1990 period.

POPULATION BY COMMUNITY, 1980-1990

Race and Ethnicity

Minneapolis became more ethnically and racially diverse in the 1980s. The city's minority population increased by nearly 32,300 persons, increasing from 12.7 percent of the total population in 1980 to 21.6 percent in 1990. Racial diversity is most noticeable in the younger age categories where approximately 40 percent of the child population are children of color in 1990. By 2000, over 70 percent of children in public school are children of color.

Although the city's total population hardly changed during the 1980s, significant shifts occurred within specific racial and ethnic populations. Between 1980 and 1990, the city's white population declined by 34,864, or 12 percent. This decline, while significant, is not near the level of non-minority population loss that occurred between 1970 and 1980, when the white population declined by 82,582. Growth in the city's minority population has accelerated since 1970. Between 1970 and 1980 the city's minority population increased by 19,133 persons; the increase in the city's minority population between 1980 and 1990 was 32,296 persons.

The Minneapolis Public School system had a population of 47,839 students at the end of the 1999-2000 school year. The racial composition of students is 44 percent Black, 29 percent white, 15 percent Asian, 8 percent Hispanic, and 5 percent American Indian. The schools also report that in 1998 the most prevalent languages spoken by participants in the English Language Learners program are Hmong (3,492 persons enrolled), Spanish (1,749 persons enrolled), and Somali (1,005 persons enrolled).

The percent of the population in each age bracket varies by race and ethnicity, according to the 1990 Census. Each of the ethnic population groups has a significant proportion of the city's children. The average percentage of children 17 or less (school age and pre-school) was greater than 30 percent for people of color. The white population under 17 represented only 15 percent of the total white population. On the other end of the age spectrum, the white population has a higher percentage of older people than the other ethnic classifications. Seniors 65 and over represented 15.5 percent of the white population. The percentages for the 65 and over age for people of color represents less than 5 percent on average.

MINORITY POPULATION BY COMMUNITY, 1980 AND 1990

Family Characteristics

The percentage of children living in married couple families declined from 62.8 percent in 1980 to 54.4 percent in 1990. In 1990, 43 percent of the adult population was single, up from 39 percent in 1980.

PARENTS WITH CHILDREN, OWNING THEIR HOME

Income and Poverty

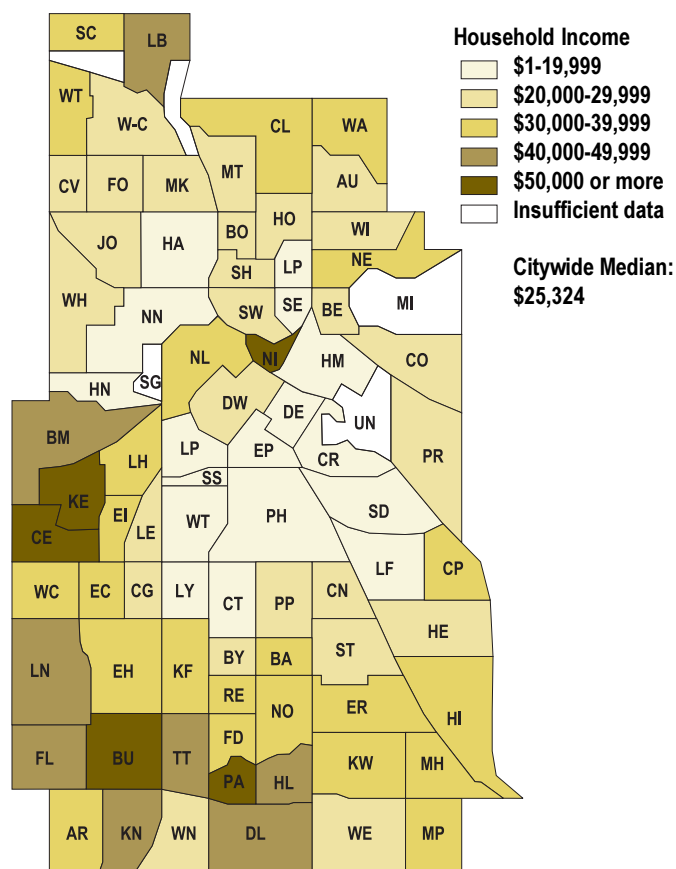

In 1989, the median household income, while rising slightly for city residents, remained below the income level for metropolitan area and U.S. residents as a whole.

In 1990, the median household income for Minneapolis represented 69 percent of the metropolitan and 84 percent of the U.S. median household income. The median family income for Minneapolis was 75 percent of the metropolitan and 94 percent of the U.S. median family income. In 2000, the estimated median family income for the Twin Cities Metropolitan Statistical Area is \$68,600.

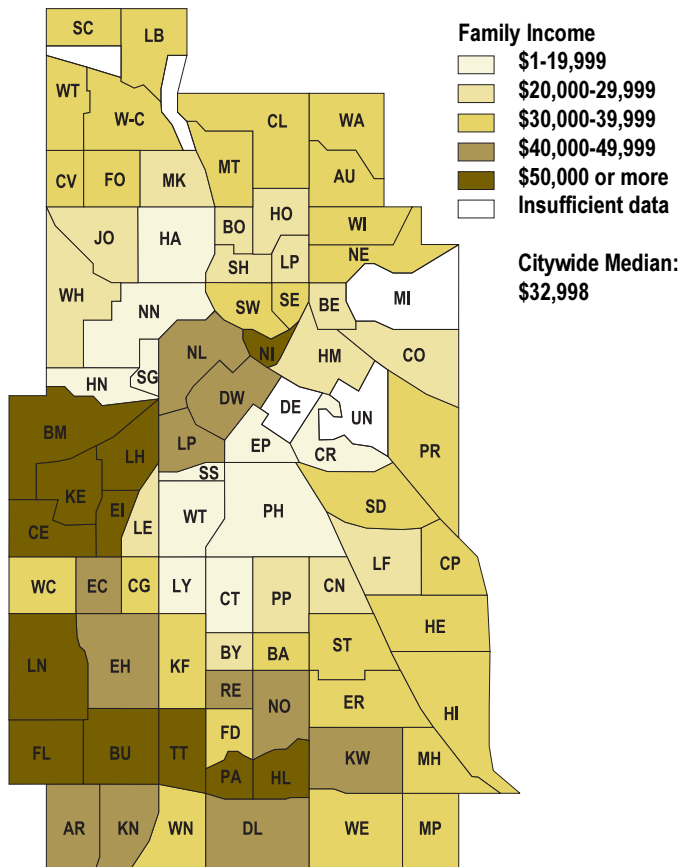

1990 MEDIAN HOUSEHOLD AND FAMILY INCOME

	Mpls.	Metro Area	U.S.
Median Household Income	\$25,324	\$36,678	\$30,056
Relative Percentage		69.0%	84.3%
Median Family Income	\$32,998	\$43,781	\$35,225
Relative Percentage		75.4%	93.7%

MEDIAN HOUSEHOLD INCOME BY NEIGHBORHOOD, CITY OF MINNEAPOLIS, 1989

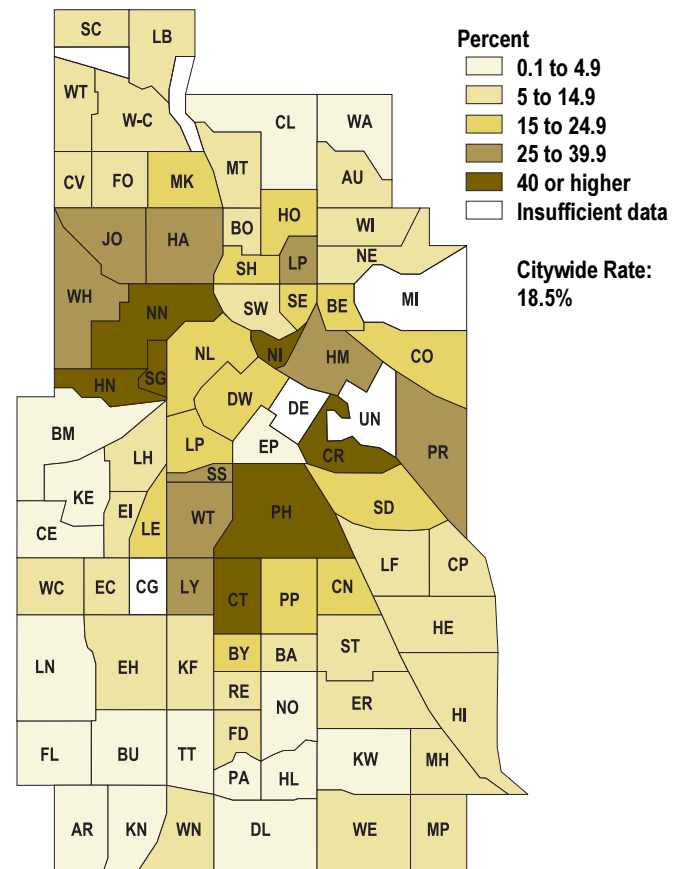

MEDIAN FAMILY INCOME BY NEIGHBORHOOD, CITY OF MINNEAPOLIS, 1989

Geographic Distribution of Poverty

The following map geographically depicts the poverty status of Minneapolis neighborhoods. The map reflects a continued uneven distribution of poverty concentration and income levels across the city, with the highest concentrations of poverty located in areas adjacent to the downtown core on the near north and south sides of the city, and farther south along the 35W freeway corridor.

PERCENT OF RESIDENTS BELOW POVERTY LEVEL BY NEIGHBORHOOD, CITY OF MINNEAPOLIS, 1989

Between 1979 and 1989 the poverty rate for all city residents increased from 13.5 percent to 18.5 percent. As in 1979, children are more likely to live in poverty than adults; and, during the previous decade, the poverty rate for children increased at a greater rate than the poverty rate for adults.

Individual and family poverty rates for city residents were each more than twice that of the comparable rates for the metropolitan area, which were 8.1 percent for individuals and 5.8 percent for families.

Throughout the 1980s, the poverty rate for the city's children remained significantly higher than the poverty rate for adults. One-third of all children under the age of five lived in poverty in 1989. By contrast, 15 percent of all resident adults lived in poverty in 1989. The poverty rate for children under the age of five remained the highest among all age categories. It increased significantly during the last decade, rising from 22 percent in 1979 to 33 percent in 1989. Overall, for all children under the age of 18, the poverty rate increased from 18 percent in 1979 to 30 percent in 1989.

* Note: The number of persons for whom poverty status is determined differs from the total population. The total population uses data from the short and long form to include every person. The poverty question is only asked of those who received the long form. Therefore, the numbers are adjusted to approximate the entire population.
